STOP FALSE ALARM FUNCTION

Example: A temperature sensor is inserted in a Freezer and Hi-Low limit is set as 2 to 8 °C. Now as many times the freezer door is opened either to put in or take out a sample, naturally those many times it will make the temperature rise. Which will immediately initiate an alarm. But in this scenario, if we make JUDGEMENT TIME for 2 minutes, after closing the door – Freezer will be back to its normal Temperature and it will not shoot
